

Feedlr User Guide

(This user guide is under development)

Feedlr is an application that lets the user create multiple feeds containing news from specifically chosen Facebook and Twitter users. By giving the application access to your accounts, creating a feed of your closest friends from both Facebook and Twitter is a breeze.

Your account details, such as username and password, are only handled by Facebook's and Twitter's secure login plugins. Therefore, the application does not know of your personal information. That way, if your Android phone is stolen, there is no way to retrieve your personal information from the application.

If no feeds are created, the user will simply see an empty feed with a button that says *New feed*. When a feed is created, it will be visible in the default view in the application. Scrolling down (moving the finger upwards on the screen) will show the user older news in the feed, while scrolling up will do the opposite. If the user scrolls up when the feed is already at its top, the feed will refresh (fetch new data if possible).

A user can add as many feeds as it wants to, there are no limitations. When a second feed is created, it can be found by sliding the first feed to the left (moving the finger to the left of the screen). This way the user can toggle between all the feeds available. A new feed will always be placed to the right of the last created feed. Therefore, all feeds are placed in a chronological order.

System Requirements:

Android 2.3 (Gingerbread) or higher.

Common tasks:

Authorize Facebook account:

1. Choose *settings* from the default view.
2. Choose *authorize Facebook*.
3. A login page will appear. Type the username and password to your Facebook account and click *login*.
4. Facebook will now show you what permissions feedlr is asking for. Read them and accept them by choosing *accept*.
5. The settings screen will appear, you have now authorized your Facebook account to be used when creating a feed.

Authorize Twitter account:

1. Choose *settings* from the default view.
2. Choose *authorize Twitter*.
3. A login page will appear. Type the username and password to your Twitter account and click *login*.
4. The settings screen will appear, you have now authorized your Twitter account to be used when creating a feed.
