

Feedlr Requirements

The user shall be able to bind feedlr to social medias such as Twitter and Facebook to give the application the access to get data.

Each social media should be optional for the user, there shall not be any requirment to add a specific media.

The user should be able to create own feeds consisting of friends from different social medias they wish to follow in that specifik feed.

For a consistent GUI every feed will use the same layout-template.

The user will be able to view where every post originated from.

There will be a actionbar at the top at all times while the user is viewing his feeds.

The user should easily see how to create a new feed the first time the application is used.

The application will store all posts and feeds in a database to minimize the use of bandwidth and to prevent loss of data when switching activities.

The Application shouldn't store any passwords from the different social medias. The passwords will be handled by the built in systems for Android.

It shouldn't take more than 250 milliseconds for the user to switch view in the application.
